# Dissemination of Research Results

- ▶ Why?
  - ▶ Submit results for critical review
  - ▶ Inform other researchers, users, society
  - ▶ Satisfy requirements from funders or customers
  - ▶ Promote research career – publish or perish
- ▶ To whom?
  - ▶ Other researchers
  - ▶ Potential users
  - ▶ Students
  - ▶ The general public
  - ▶ Funding bodies
  - ▶ Customers

# The Receiver

# The Receiver

# The Receiver

# The Receiver

# How?

## Written:

1. Publications (indexed and archived)
2. Internal reports (public or confidential)
3. Digital archives, web pages, etc.

## Oral:

1. Lectures (especially at conferences)
2. Demonstrations, posters, discussions, etc.
3. Internal meetings (seminars, workshops)

## Written Genres – Single Topic

### Papers (short)

1. Journal article – refereed and approved by editorial board
2. Conference paper – often but not always refereed
3. Technical report – usually not refereed

### Monographs (long)

1. Book – standards of refereeing depends on publisher
2. Thesis – refereed in examination, may or may not be published

## Written Genres – Other

### Collections

1. Conference proceedings – collection of conference papers
2. Edited volume – book with different chapter authors

### Meta-genres

1. Survey or handbook article
2. Review in scientific journal
3. Bibliography
4. Abstract

# Oral Genres

## Lecture

- ▶ Presentation by 1 person followed by discussion (large group)
  1. Conference talk (15–30 min)
  2. Invited talk (45–90 min)

## Seminar

- ▶ Presentation or introduction by 1 or more persons with more or less continuous discussion (small group)

## Panel

- ▶ Short presentations on a set topic from a selected group of persons with questions and opinions from the audience

# Mixed Genres

## Poster

- ▶ Written presentation displayed on poster board
- ▶ Oral interaction with interested audience
- ▶ Sometimes combined with short talk (1–5 min)

## Demonstration

- ▶ System demonstration (or similar)
- ▶ Oral interaction with interested audience
- ▶ Sometimes combined with poster

## Requirements on Scientific Reports

- ▶ Ethics:
  - ▶ Sensitive information requires permission and anonymization
- ▶ Accessibility:
  - ▶ Reports should be understandable by target audience
- ▶ Novelty and relevance:
  - ▶ Results should be novel, original, unpublished
  - ▶ Relevance to research area should be made clear
- ▶ Quality:
  - ▶ Claims clearly stated and possible to challenge (falsifiability)
  - ▶ Claims supported by arguments and/or evidence (justification)
  - ▶ Claims not misleading (e.g., by withholding information)

# Scientific Writing

Writing takes time (to learn)

- ▶ Practice makes perfect – write a lot!
- ▶ Writing requires rewriting – start early!

Scientific writing is a standardized genre

- ▶ Collect good examples – and study them!
- ▶ Copy structure and formulations – but not content!

# The Structure of Scientific Publications

### Abstract

We consider the construction of part-of-speech taggers for resource-poor languages. Recently, manually constructed tag dictionaries from Wiktionary and dictionaries prepared via bootstrapping have been used as type constraints to overcome the scarcity of annotated data in this setting. In this paper, we show that additional noise constraints can be projected from a resource-rich source language to a resource-poor target language via word-aligned biests. We present several models to this end, in particular a partially observed conditional random field model, which coupled taken as a **self-contained summary** of the paper. Average scores on eight previously studied Indo-European languages, our model achieves a 25% relative error reduction over the prior state of the art. We further present successful results on seven additional languages from different families, empirically demonstrating the applicability of coupled token and type constraints across a diverse set of languages.

### 1 Introduction

Supervised part-of-speech (POS) taggers are available for more than twenty languages and achieve accuracies of around 95% on in-domain data (Petrov et al., 2012). Thanks to their efficiency and robustness, supervised taggers are routinely employed in many natural language processing applications, such as syntactic and semantic parsing, named-entity recognition and machine translation. Unfortunately, the resources required to train supervised taggers are expensive to create and unlikely to exist for the majority of written

languages. The necessity of building NLP tools for these resource-poor languages has been part of the motivation for research on unsupervised learning of POS taggers (Christodoulopoulos et al., 2010).

In this paper, we instead take a weakly supervised approach towards this problem. Recently, learning POS taggers with type-level tag dictionary constraints has gained popularity. Tag dictionaries, mostly projected via word-aligned biests, have bridged the gap between purely unsupervised and fully supervised taggers, resulting in an average accuracy of over 83% on a benchmark of eight Indo-European languages (Das and Petrov, 2011). Li et al. (2012) further improve upon this result by employing “**arbitrary**” as a tag dictionary source, resulting in the highest best published result of almost 85% on the same setup.

Although the aforementioned weakly supervised approaches have resulted in significant improvements over fully unsupervised approaches, they have not exploited the benefits of token-level cross-lingual projection methods, which are possible with word-aligned biests between a target language of interest and a resource-rich source language, such as English. This is the setting we consider in this paper (32). While prior work has successfully considered both token- and type-level projection across word-aligned biests, **estimating the model parameters of generative taggers** (Perovoy and Ngai, 2001; Xi and Hwa, 2005; Tenenbom, 2006), a key observation underlying the present work is that **token- and type-level information offer different and complementary signals**. On the one hand, high confidence **token-level projections offer precise constraints on a tag in a particular context**. On the other hand, manually con-

# The Anatomy of a TACL Style Article

**6 Conclusions**

We considered the problem of constructing multilingual POS taggers for resource-poor languages. To this end, we explored a number of different models that combine token constraints with type constraints from different sources. The best model was trained with a partially observed CRF model that effectively integrates these complementary constraints. In an extensive empirical study, we showed that this approach substantially improves on the state of the art in this context. Our best model significantly outperformed the second best model on 10 out of 15 evaluated languages, when trained on identical data sets, with an insignificant difference on 3 languages. Compared to the prior state of the art (Li et al., 2012), we observed a relative reduction in error by 25%, averaged over the eight languages common to our studies.

**Acknowledgments**

We thank Alexander Rush for help with the hypergraph framework that was used to implement our models and Klaus Macherey for help with the best extraction. This work is based on many discussions with Yves Gauthier, Christopher Manning, Gaochen and Han Zhang. We also thank the editor and the three anonymous reviewers for their valuable feedback. The first author is grateful for the financial support from the Swedish National Graduate School of Language Technology (GSLT).

## Presenting non-English examples

- ▶ Often useful to show language examples
- ▶ You cannot expect all readers to know all languages
- ▶ Help the reader understand your key point(s) with the example!
- ▶ Standard presentation
  - ▶ Foreign example
  - ▶ Word-by-word gloss
  - ▶ 'Translation'

## Swedish example

- (1) I förrgår gick pennan av  
In past yesterday went the pen off  
The day before yesterday, the pen broke

Or more detailed:

- (2) I förrgår gick pennan av  
In past yesterday go.PAST pen.DEF.SG off  
The day before yesterday, the pen broke

## More on non-English examples

- ▶ Think about why you include the example
  - ▶ What does the reader need to know in order to understand the point?
- ▶ Depending on this answer, the amount of detail can vary
  - ▶ Translation only
  - ▶ Translation and simple gloss
  - ▶ Translation and detailed gloss
- ▶ For detailed glosses: Leipzig Glossing Rules
- ▶ Latex packages: Covington, gb4e, linguex, . . .

## Ethics: plagiarism

- ▶ Always attribute references to ideas of others!
- ▶ Quotations
  - ▶ Use quotations marks, give reference and page number
  - ▶ Do not overuse. Mainly useful for definitions, et.c.
- ▶ Paraphrasing
  - ▶ Describing the work of others in your own words. Give reference
  - ▶ Changing a few words, tense, et.c. is not enough.
  - ▶ Tip: do not look at the paper you are paraphrasing, write from memory (and then double check)
- ▶ Images:
  - ▶ Often under copyright. If so: **DO NOT COPY!**
  - ▶ If permissive license: you can copy, and give reference
  - ▶ Otherwise: draw your own variant, and give reference

## Ethics: data manipulation

- ▶ Fabrication
  - ▶ Making up false results
  - ▶ Manipulating experiments
- ▶ Cherry picking / suppressing evidence
  - ▶ Only presenting results that supports your hypothesis
  - ▶ Setting up the study so that the experiments are not representative
  - ▶ Not (attempting to) controlling for confounding variables

DO NOT DO THIS!

# Giving Oral Presentations

Preparation is the key

- ▶ Think through what you want to say
- ▶ Formulate key passages in concrete sentences
- ▶ Prepare audiovisual aids (if relevant)

Practice makes perfect

- ▶ Rehearse the presentation (many times)
- ▶ Time the presentation and note any disfluencies
- ▶ Modify and rehearse until fluent

## The Structure of Oral Presentations

Oral presentations are basically structured as written reports but

- ▶ typically contain less material due to time constraints (especially the background part)
- ▶ are often less formal and detailed due to real-time processing (the big picture instead of the formal details)
- ▶ can be more repetitive due to memory limitations (get the take-home message across)

The discussion part:

- ▶ Listen to the question
- ▶ Answer the question – if you can

## Audiovisual Aids

Slides provide support for the presentation

- ▶ Key points and important concepts
- ▶ Graphical illustrations (and sound if relevant)
- ▶ Material that is hard to present orally (equations, examples)

But remember

- ▶ Not too much information (or too small fontsize) on one slide
- ▶ Not running text (to be read aloud)
- ▶ Slides should support presentation, not vice versa

## Geoff Pullum's Golden Rules

- ▶ Don't ever begin with an apology
- ▶ Don't ever underestimate the audience's intelligence
- ▶ Respect the time limits
- ▶ Don't survey the whole damn field
- ▶ Remember that you're an advocate, not the defendant
- ▶ Expect questions that will floor you

## Requirements for your course papers

- ▶ Follow the TACL guidelines
- ▶ Use the TACL Latex templates
- ▶ 4–7 pages of content + references
- ▶ Content is text + tables + figures
  - ▶ Only references and acknowledgement allowed on additional pages

## Deadlines and submissions

- ▶ December 13: First version of **full paper**
- ▶ January 14: final version of paper, taking reviews into account
- ▶ If you miss a deadline (AVOID!)
  - ▶ First version: January 14
  - ▶ Second version: February 18
  - ▶ You may present during the workshop, if your project is ready to present (Jan 13)
- ▶ Reviewing and first version will be handled through a conference management system – more information will come!

## Final seminar

- ▶ January 13: all day
- ▶ Will be held on Campus
- ▶ Online presentations will only be allowed if there are exceptional circumstances (for instance travel bans). If this is the case for you, you need to contact Sara in advance, and get approval.
- ▶ There will probably be two types of sessions
  - ▶ Plenary
  - ▶ Half class

## Next group seminar

- ▶ Special theme: ethics
- ▶ Read these papers:
  - ▶ Main reading: Hovy, D. and Spruit, S. L. *The Social Impact of Natural Language Processing*. ACL 2016.
  - ▶ Additional reading: Bender, E. M., Gebru, T., McMillan-Major, A. and Shmitchell, S. *On the dangers of stochastic parrots. Can language models be too big?* FAccT'21
- ▶ Reflect on ethical issues related to your projects
- ▶ Also feel free to think about positive consequences of your project!

## Next sessions, and changes

- ▶ Seminar next week: cross-lingual group on Zoom!
- ▶ In TimeEdit there is a lecture on November 17. It was an extra booking, and it will be cancelled
- ▶ Latex tutorial, 23/11
  - ▶ Mainly help with any Latex issues you may have
  - ▶ Some exercises for practice
  - ▶ Only on Campus
- ▶ For those of you who have not yet passed the proposal, remember to hand in the main proposal, and the popular science abstract by November 5!
